

**Session Title:** Real-time earthquake alert system:  
Leveraging Serverless architecture with Confluent Kafka

Vlad Onețiu

## Who am I ?

- **Cloud development & Cyber Security**
  - projects in Data Science domain
  - multiple security researches for Romanian Banks
- **AWS Community Builder in Serverless**

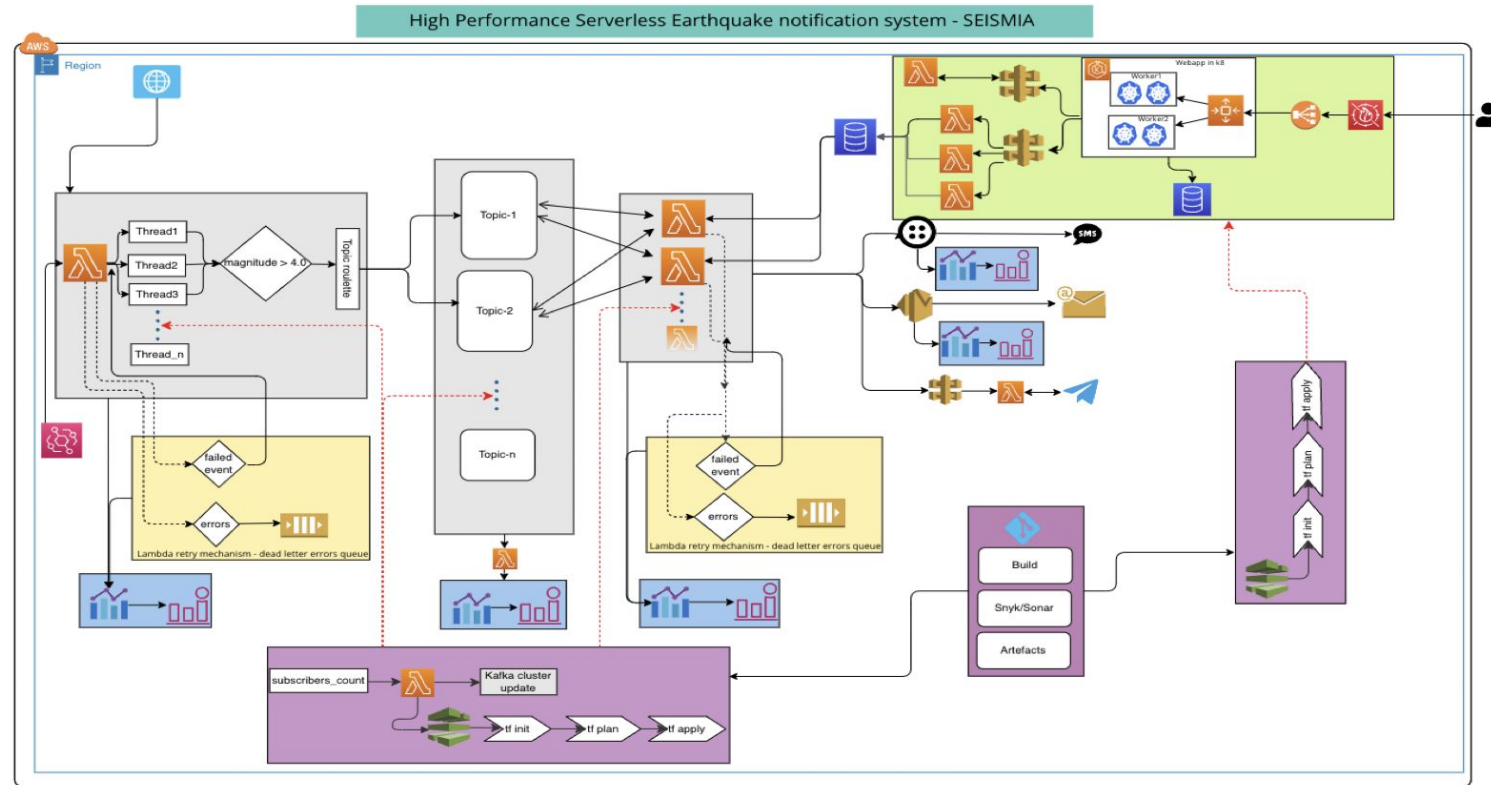

**Mail** onetiuvlad@gmail.com

**Linkedin** <https://www.linkedin.com/in/vlad-onetiu/>

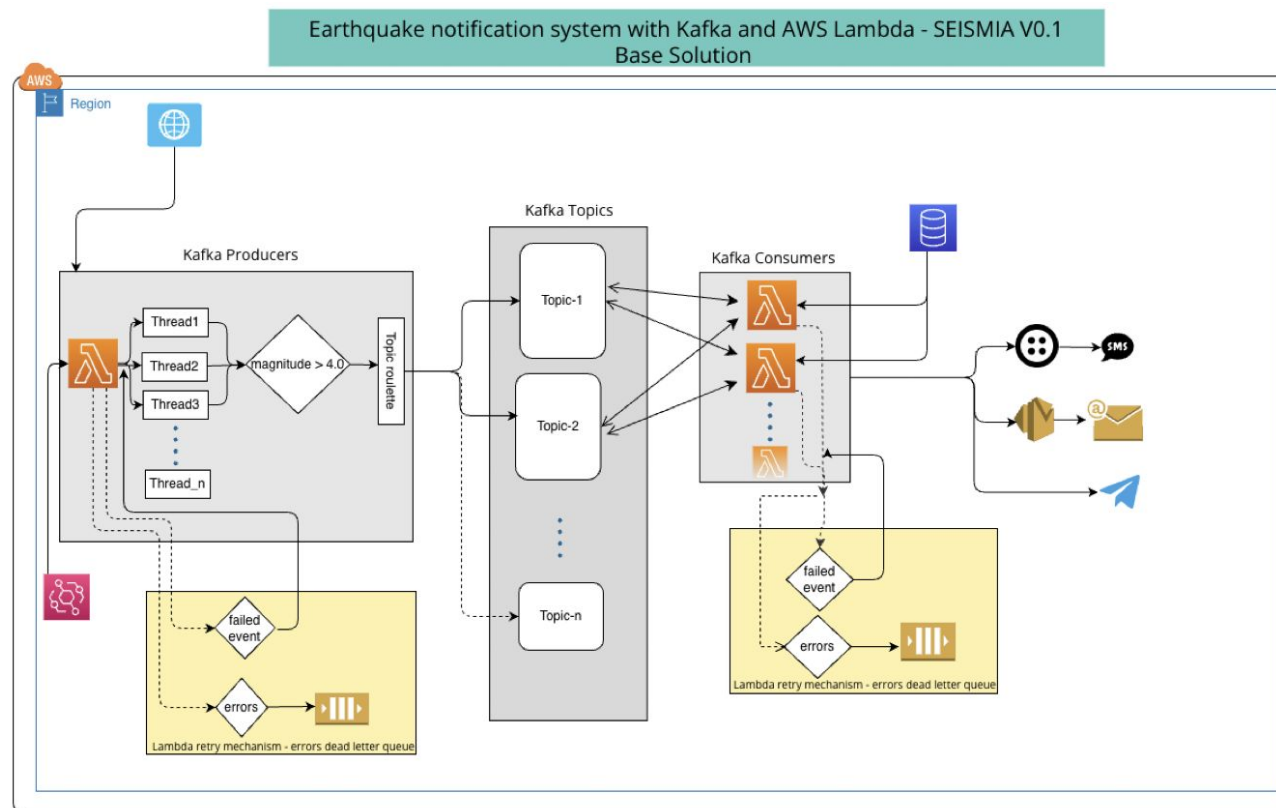

# The story behind the research project

- Why the need for a high performance earthquake notification system
- Where to find good real time earthquake data
- Why choosing the Serverless ecosystem

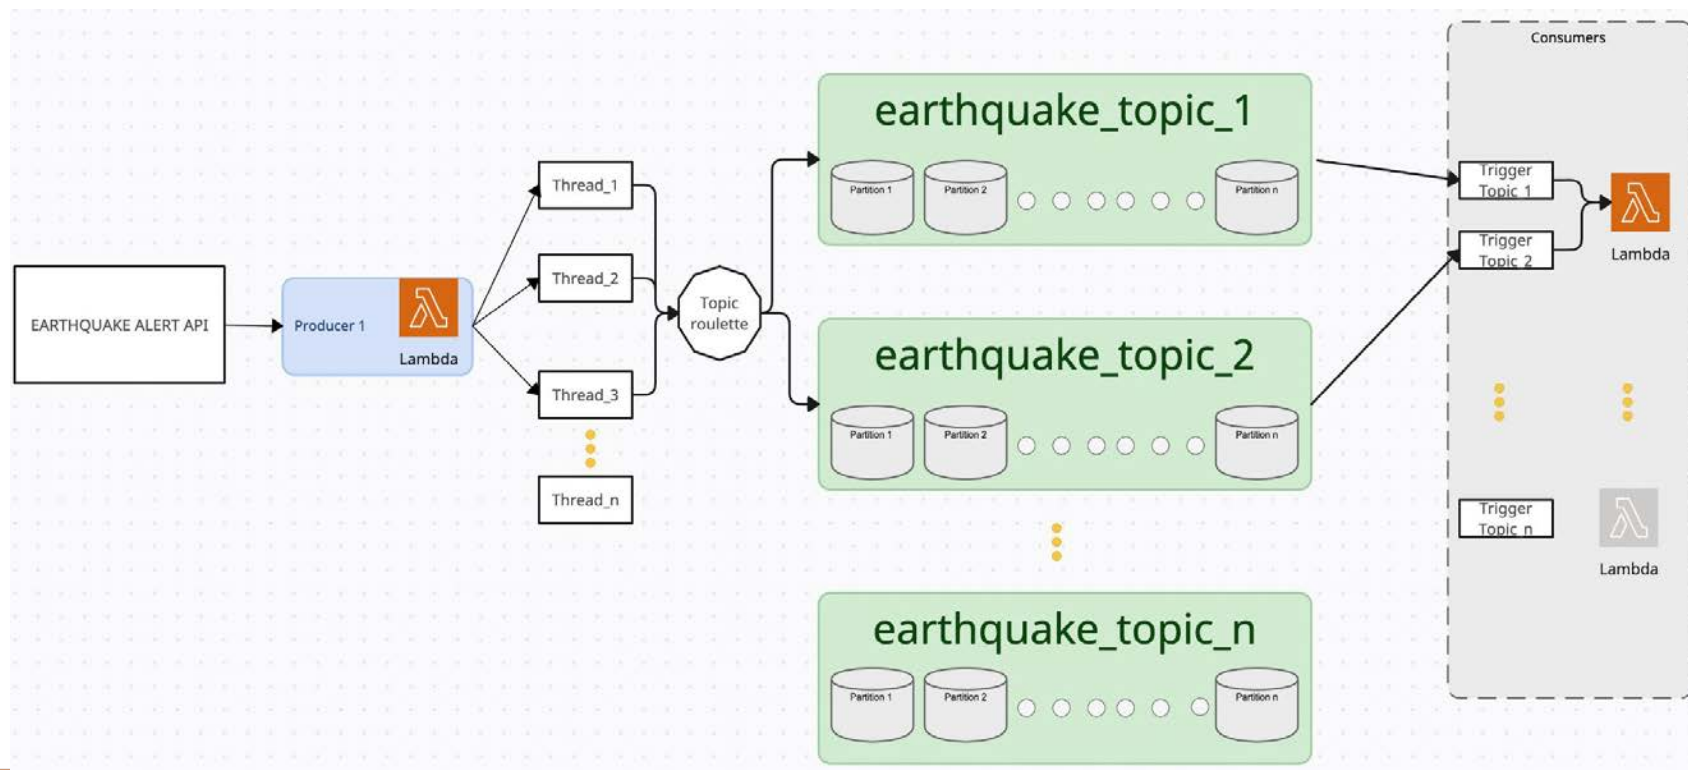

# Architecture of the Serverless notification system

# Architecture of the base notification system

# Architecture of Kafka integration in Serverless context

# Lambda Kafka Producer key elements

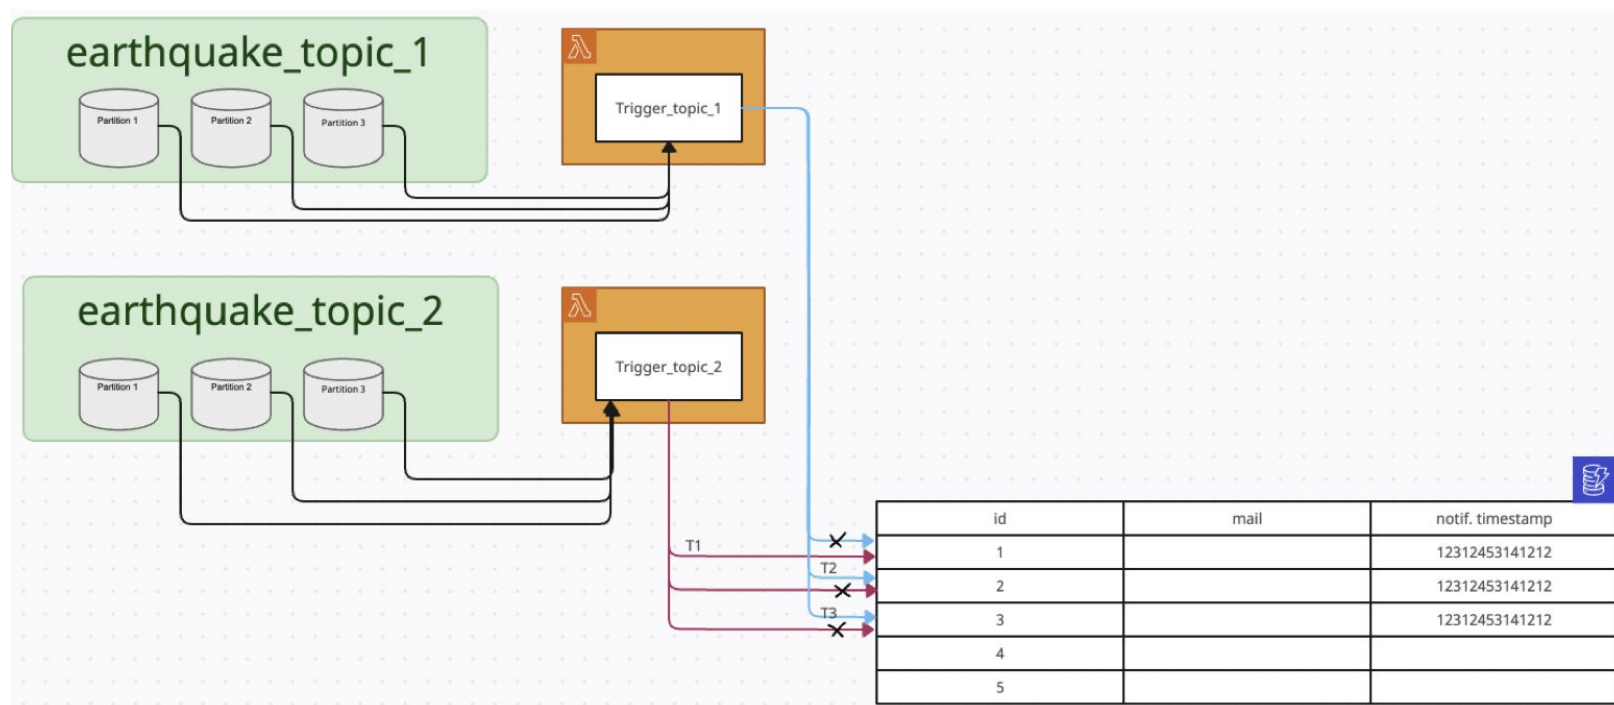

- Multithreading in the Kafka Producer
- Using thread lock to not write to same topics from separate threads
- Using partition number to not overwrite data in partitions
- Using Lambda retry and SQS Dead Letter for errors

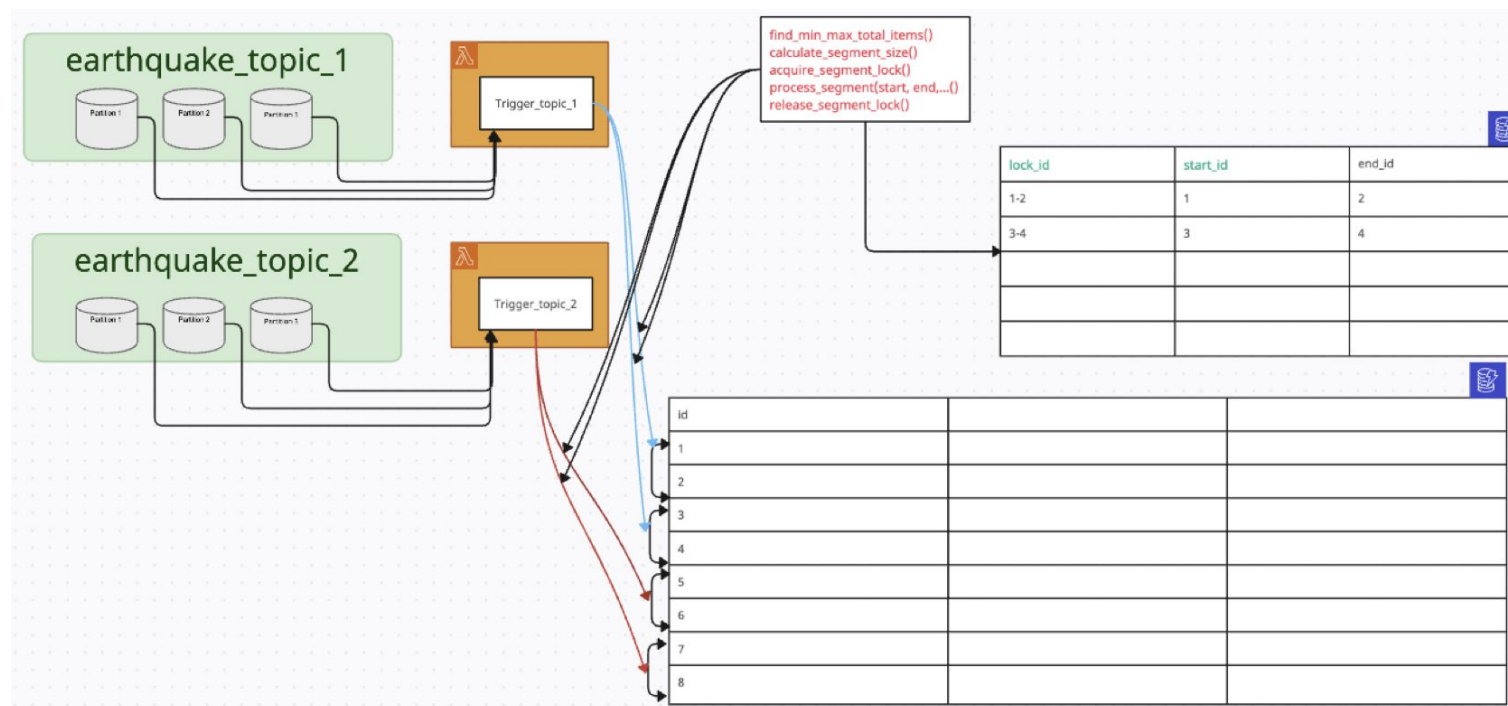

# Lambda Kafka Consumer key elements

- Custom timestamp lock mechanism for parallel Dynamo item update
- Optimistic Locking in the custom Dynamo concurrency control
- Using Lambda retry and SQS Dead Letter for errors
- Lambda consumers using cold start / warm start

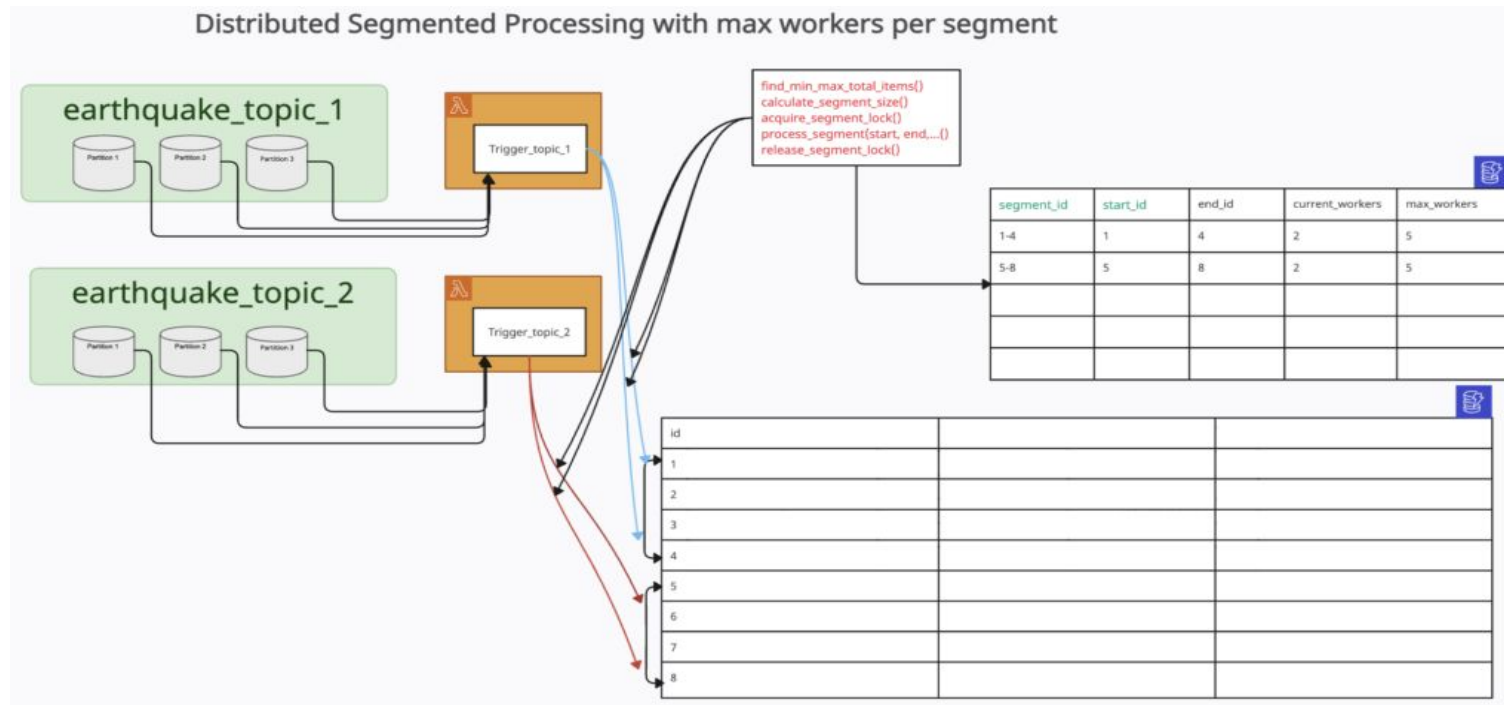

# Lambda Kafka consumer integration with Database - Custom Dynamo locking - first version

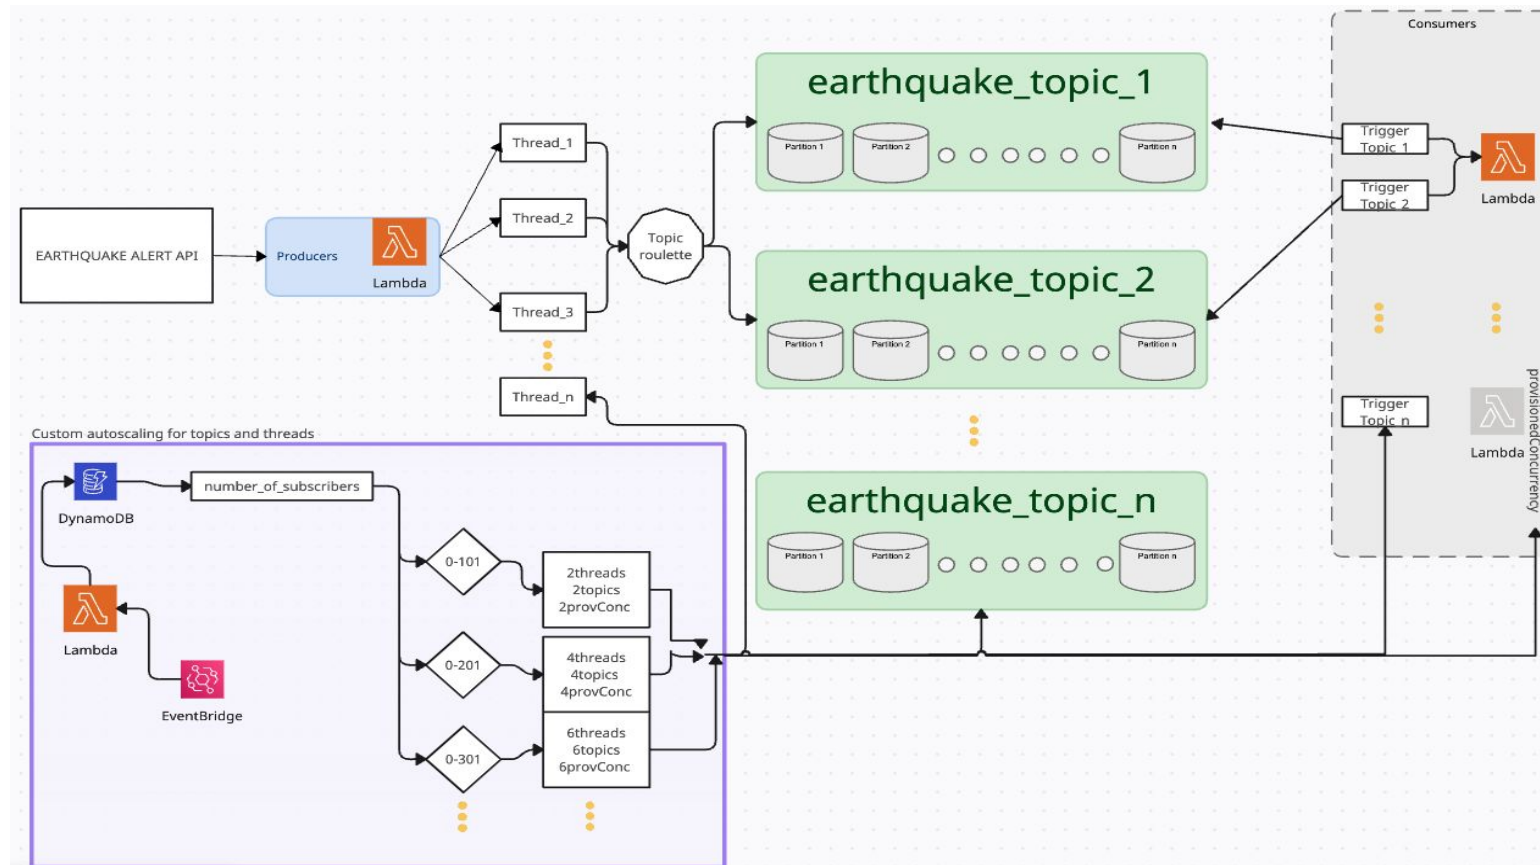

# Custom Dynamic Segmented Subscriber Processing| Lambda Kafka Consumer - Domino style

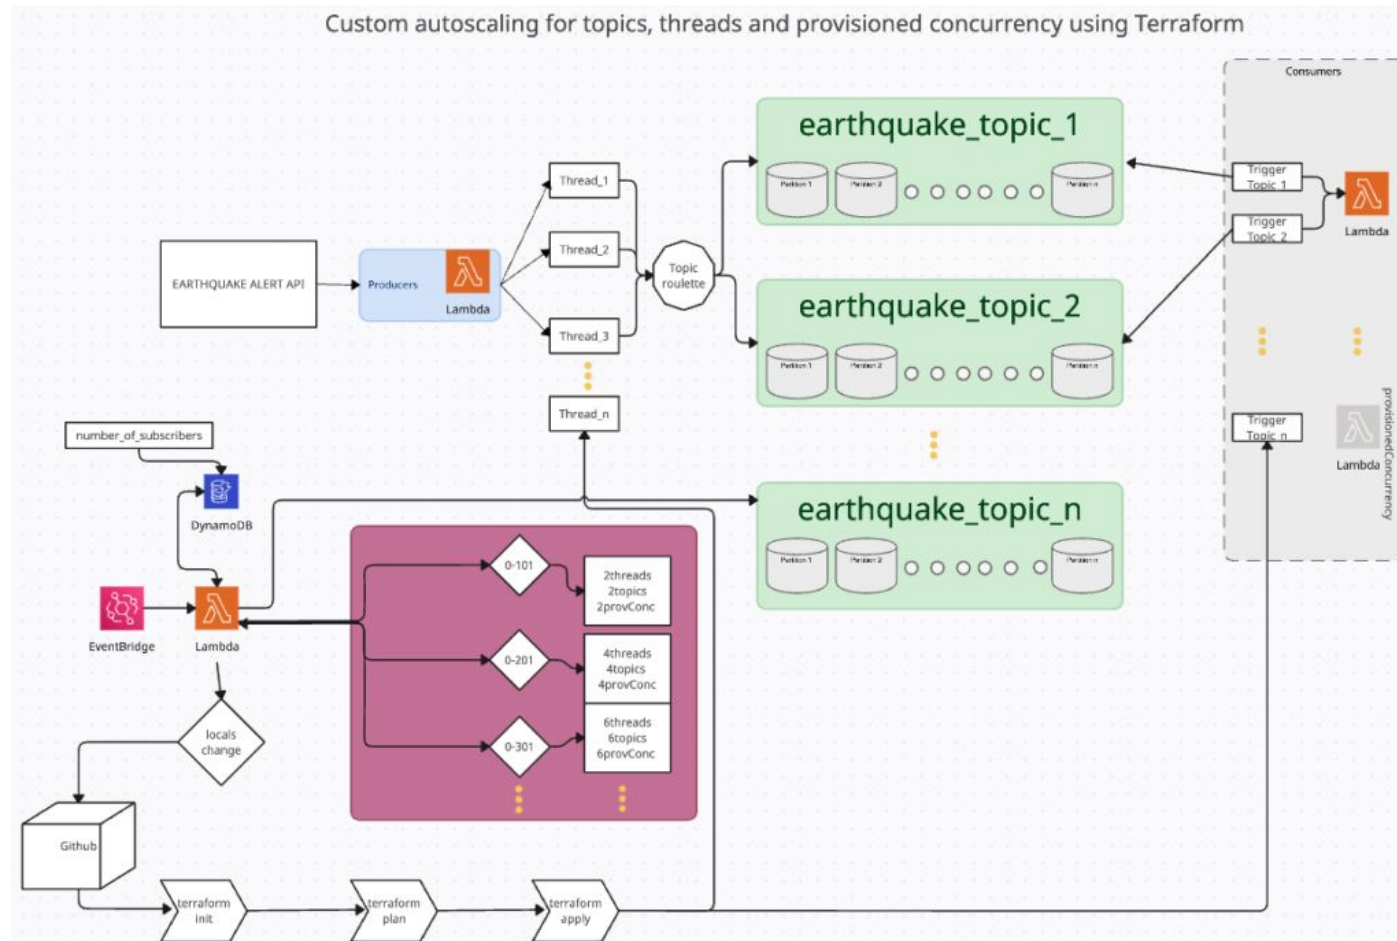

# DynamoDB parallel distribution and segmentation in Lambda Kafka Consumer - max invocation/locks per segment - Domino style

# Custom autoscaling in Serverless for Earthquake notification system

# Custom autoscaling in Serverless using Terraform and Github Actions

# Q & A
