From ML to AI Decisioning

The Overwhelmed Customer

Why 'Best Time' Isn't Enough

Customers receive **dozens** of messages daily across multiple channels.

If we keep sending at
the **perfect** time, why
are customers **tuning**
out?

Consequences of Overload

The Promise of Prediction

How STO Began

Send Time Optimization (STO)

Using historical data & ML to predict the best time to send a message to maximize engagement.

The Original STO Process

When Prediction Breaks

The Limits of ML

“High **probability** does
not equal high **wisdom**.”

Prediction

Decision

Marketing is now a complex, **real-time**, cross-channel conversation.

4

The Shift to Decisioning

From 'When?' to 'Should We?'

ML-Based STO (Prediction)

Asks: What time is best?

Static predictions

Single signal analysis

Optimizes for open rate

AI-Based STO (Decisioning)

Asks: What is the best action?

Context-aware decisions

Multi-signal reasoning

Optimizes for relationship

**ML Prediction
System**

**ML
System**

**Context-Aware AI
Decisioning
System**

ML Prediction says: **Send now**. It sees the highest historical probability of an open.

10:30 AM

AI Decisioning says: **Hold**. It sees the customer is near their fatigue limit.

From Timing to Trust

The Business Impact

Long-Term Business Impact

The Evolution of Smart Messaging

Past

Rule-Based Timing: Manual time windows and basic segmentation.

Present

ML-Based Prediction: Predictive models using historical patterns.

Future

AI-Based Decisioning: Context-aware, intelligent orchestration.
